In this paper, the current knowledge about Molar Incisor Hypomineralization (MIH) is presented. MIH is defined as hypomineralization of systemic origin of one to four permanent first molars...

(PDF) Molar Incisor Hypomineralization (MIH): Clinical ...

The term molar incisor hypomineralization (MIH) was introduced in 2001 to describe the clinical ap- pearance of enamel hypomineralization of systemic origin affecting one or more permanent first molars (PFMs) that are associated frequently with affected incisors.1Also referred to as “hypomineralized” PFMs,2“idiopathic enamel hypomineralization,”3,4“dysmineralized” PFMs,5

Molar Incisor Hypomineralization: Review and ...

Molar incisor hypomineralization (MIH) is an alarming problem with considerable challenges in management. This study aimed to evaluate and compare the knowledge, perceptions, and clinical experiences of molar incisor hypomineralization (MIH) between general dental practitioners (GDPs) and paediatric dentists (PDs) in Hong Kong.

Knowledge, perceptions, and clinical experiences on molar ...

Molar-incisor hypomineralization (MIH) is a condition that is defined based on its peculiar clinical presentation. Original reports on the etiology of the condition and possible risk factors were inconclusive, and we refuted the original suggestion that MIH is an idiopathic condition and suggested t ...

On the Variable Clinical Presentation of Molar-Incisor ...

This book is a wide-ranging reference on current clinical and scientific knowledge regarding the various aspects of molar incisor hypomineralization (MIH). Background information is first presented on the structural properties of hypomineralized enamel, the prevalence of MIH, and potential etiological factors.

Molar Incisor Hypomineralization - A Clinical Guide to ...

The various associations between the affected teeth were evaluated in the sub-group of 225 MIH children with all ‘index’ teeth erupted (1,286 affected teeth, 776 molars and 510 incisors), with mean number of affected teeth per child being 5.7; separately for molars 3.4 and for incisors 2.2.

Molar-Incisor Hypomineralisation (MIH). Retrospective ...

Molar-incisor hypomineralization (MIH) is a condition that is defined based on its peculiar clinical presentation. Reports on the etiology of the condition and possible risk factors are inconclusive and the original suggestion that MIH is an idiopathic condition is often cited.

On the Etiology of Molar-Incisor Hypomineralization

To compare responses to electrical pulp test (EPT) and cold test among molar incisor hypomineralization (MIH)-effected and not MIH-effected carious teeth before and after administration of local anesthesia for caries removal.

Local Anesthesia in Molar Teeth With Molar Incisor ...

ReviewMolar Incisor Hypomineralisation (MIH) is defined as a hypomineralisation of systemic origin of one to four permanent first molars frequently associated with affected incisors. MIH molars are fragile and caries can develop very easily in those molars.

Molar Incisor Hypomineralisation (MIH)

Regarding the term used at present ‘molar-incisor-hypom- ineralisation’, demarcated opacities of the same type as in MIH have been observed on second primary molars, tips of permanent canine cusps, second permanent molars and the premolars.

Best Clinical Practice Guidance for clinicians dealing ...

Molar-incisor hypomineralization (MIH) is a developmental defect of the human dentition that primarily affects the enamel of the first permanent molars and can involve the incisors. The prevalence of MIH ranges from about 3-40% in the population, making it relatively common and a condition that will challenge clinicians on a regular basis.

Diagnosis and treatment of molar-incisor hypomineralization

Recently, Weerheijm et al. suggested the term Molar Incisor Hypomineralization (MIH) and defined it as hypomineralization of systemic origin of one to four permanent first molars frequently...

Molar Incisor Hypomineralization (MIH): Clinical ...

Molar Incisor Hypomineralization (MIH) is defined as a hypomineralization of systemic origin of one to four permanent first molars, frequently associated with similarly affected permanent incisors. The affected molars are related to major clinical problems in severe cases.

Molar Incisor Hypomineralization (MIH): Conservative ...

MOLAR INCISOR HYPOMINERALIZATION (MIH) A global burden concerning one in seven children1, 2 MIH is a common developmental condition affecting primarily one or more first permanent molars. The central incisors may be affected as well, but this usually occurs to a lesser extent.

MOLAR INCISOR HYPOMINERALIZATION (MIH)

Molar incisor hypomineralisation (MIH) is a type of enamel defect affecting, as the name suggests, the first molars and incisors in the permanent dentition. MIH is considered a worldwide problem and usually occurs in children under 10 years old.

Molar incisor hypomineralization - Wikipedia

Molar incisor hypoplasia (MIH) is a condition that affects the incisors and molar teeth. It has a varied prevalence of 2.8–25%. However, a recent systematic review has reported a wide variation in defect prevalence (2.4–40.2%, mean around 18%) (Jälevik et al. 2010).

Molar Incisor Hypoplasia | Pocket Dentistry

This book is a wide-ranging reference on current clinical and scientific knowledge regarding the various aspects of molar incisor hypomineralization (MIH). Background information is first presented on the structural properties of hypomineralized enamel, the prevalence of MIH, and potential etiological factors.

Molar Incisor Hypomineralization | SpringerLink

MIH describes a developmental enamel defect of at least one permanent first molar with or without affected permanent incisors (Weerheijm, Jälevik, & Alaluusua, 2001). Since 2017, it has been shown that MIH/DMH can affect all deciduous and permanent teeth (Baroni & Marchionni, 2010).
